

## Compare & Contrast Method

### Topic: Cylinder & Cone

**Set Up:** To use the compare and contrast method, there are many graphic organizers available to help display the information. Venn diagrams are the most common and that is what will be used for this example. It is suggested to use graphics that represent the topic. For instance, it would be suggested to use the outline of a cylinder and the outline of a cone and have the two outlines intersect for the commonalities. Attributes that only pertain to cylinders would be contained in the cylinder outline that does not overlap with the cone. Attributes that only pertain to the cone would be contained in the cone outline that does not overlap with the cylinder.
